MINERAL COMPOSITE

NEW TECHNOLOGY IN YOUR BATHROOM

Mineral Composite Structure

75%

dolomite stone

25%

resin

STRUCTURE OF MINERAL COMPOSITE

The combination of dolomite and elastic resin imparts unparalleled durability and impact-resistance to Mineral Composite.

The resin also provides unlimited possibilities for moulding products made from this technology. The external surface is covered with nanocoat. This type of coating is also applied to the surface of yacht hulls and wind turbine blades – places exposed to constant contact with the elements: wind and water.

Its main constituent is calcium and magnesium carbonate – $\text{CaMg}(\text{CO}_3)_2$

– a snow-white mineral with a crystalline structure.

Mineral Composite is a material that fully utilises the extraordinary properties of dolomite.

Thanks to technology developed by Marmite, rock that was formed millions of years ago is turned into resistant and beautiful modern products.
